

LDAP Directory on Yealink IP Phones

Introduction

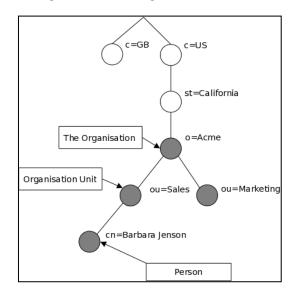

LDAP stands for Lightweight Directory Access Protocol, which is a client-server protocol for accessing a directory service. LDAP is a directory service protocol that runs over TCP/IP. The nitty-gritty details of LDAP are defined in RFC 1777 "Lightweight Directory Access Protocol". The following gives an overview of LDAP from a user's perspective.

What kind of information can be stored in the directory?

The LDAP information model is based on entries. An entry is a collection of attributes that has a globally-unique Distinguished Name (DN). The DN is used to refer to the entry unambiguously. Each of the entry's attributes has a type and one or more values. The types are typically mnemonic strings, like "cn" for common name, or "mail" for email address. The syntax of values depends on the attribute type. For example, a cn attribute might contain the value "Babs Jensen". A mail attribute might contain the value "babs@example.com".

How is the information arranged?

In LDAP, directory entries are arranged in a hierarchical tree-like structure. Traditionally, this structure reflected the geographic and/or organizational boundaries. Entries representing countries appear at the top of the tree. Below them are entries representing states and national organizations. Below them might be entries representing organizational units, people, printers, documents, or just about anything else you can think of. The following shows an example of LDAP directory tree using traditional naming.

LDAP enables you to locate organizations, individuals, and other resources such as files and devices in a network, whether on the Internet or on a corporate intranet, and whether or not you know the domain name, IP address, or geographic whereabouts. An LDAP directory can be

distributed among many servers on a network, then replicated and synchronized regularly. LDAP LDAP is particularly useful for storing information that you wish to read from many locations, but update infrequently.

This guide provides configurations on the LDAP server and IP phones, and applies to the following Yealink IP phones:

- CP860 IP phones running firmware version 71 or later
- SIP-T48G, SIP-T46G, SIP-T42G and SIP-T41P IP phones running firmware version 73 or later
- SIP-T58V/A, SIP-T56A, SIP VP-T49G, SIP-T40P, SIP-T29G, SIP-T23P/G, SIP-T21(P) E2, CP960 and W56P IP phones running firmware version 80 or later
- SIP-T54S, SIP-T52S, SIP-T48S, SIP-T46S, SIP-T42S, SIP-T41S, SIP-T40G, SIP-T27G, SIP-T19(P) E2, CP920, W60P and W52P IP phones running firmware version 81 or later
- W53P IP phones running firmware version 83 or later

Installing and Configuring the LDAP Server

An LDAP server is essentially a bit like an SQL server, which is mainly used for storing/retrieving information about people (such as contacts). The configuration settings on the phone will be altered depending on how the LDAP server is configured.

Before using LDAP feature on IP phones, you must make sure the LDAP server is prepared properly, otherwise you need to install and configure an LDAP server. This chapter shows you how to install and configure an LDAP server. We recommend you to use the OpenLDAP, Microsoft Active Directory, Microsoft Active Directory Application Mode (ADAM) or Sun One Directory Server on Windows system.

OpenLDAP

Installing the OpenLDAP Server

This section shows you how to install an OpenLDAP server on Microsoft Windows 2007 system. The OpenLDAP server software is available for free. You can download it from http://www.userbooster.de/en/download/openIdap-for-windows.aspx?l=en.

To install the OpenLDAP server:

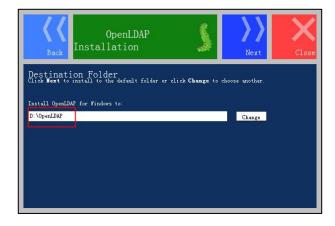

1. Double click the OpenLDAP application to start the installation. You will be prompted for the installation.

- 2. Click **Yes** to continue the installation.
- 3. Follow the default settings and click Next until the Destination Folder screen appears.

 Click Change to locate the installation path from local computer system and then click Next.

You need to remember the installation path (e.g., D:\OpenLDAP) located here. The screenshot for reference is shown as below:

 Follow the default settings and click Next until the Ready to install OpenLDAP for Windows screen appears.

- 6. Click Install to start the installation.
- 7. Click **Close** to exit the Setup Wizard.

For more information on how to install the OpenLDAP server for windows, refer to the website online:

http://www.userbooster.de/en/support/feature-articles/openIdap-for-windows-installation.aspx

Configuring the OpenLDAP Server

Editing the slapd.conf File

Access the OpenLDAP installation path. Edit the manager information for LDAP.

1. Open and edit the slapd.conf file using your favorite text editor.

Find the commands

Suffix "dc=maxcrc, dc=com"

Rootdn "cn=Manager,dc=maxcrc,dc=com"

Suffix defines the components of the domain name.

Rootdn defines the manager as a management user for accessing the LDAP server.

For example:

Suffix "dc=yealink,dc=com"

Rootdn "cn=Manager,dc=yealink,dc=com "

The suffix line means that the domain name of the LDAP directory is yealink.com. The Rootdn line defines a management user named as Manager.

If the domain name contains additional components, for example, yealink.com.cn, the suffix line will be edited as below:

Suffix "dc=yealink,dc=com,dc=cn"

```
Rootdn "cn=Manager,dc=yealink,dc=com,dc=cn"
```

2. Double click slappasswd.exe to modify the user password for the management user. Type the new password twice.

Starting the Slapd Service

To start the slapd service:

- 1. Click Start->Run.
- 2. Enter cmd in the pop-up dialogue box and click OK to enter the command line interface.
- 3. Access the server installation path. For example, execute the following commands to access

the server installation path at D:\OpenLDAP.

4. Execute the command slapd.exe -d 1 -f ./slapd.conf to start the slapd service.

If the service runs successfully, you can find the prompt "slapd starting".

C:Windows\system32\CMD.exe - slapd.exe -d 1 -f./slapd.conf
S498d32e config_build_entry: "cn=schema"
S498d32e config_build_entry: "cn=<@bcore>
S498d32e config_build_entry: "cn=<@bcore>
S498d32e config_build_entry: "cn=<@bcore"
S498d32e config_build_entry: "cn=<@bcore"
S498d32e config_build_entry: "cn=<@bcore"
S498d32e config_build_entry: "cn=<@bcore"
S498d32e config_build_entry: "cn=<?>Cosine>
S498d32e bdb_db_open: warning - no DB_CONFIG file found in directory ./data: (2)
Expect poor performance for suffix "dc=yealink,dc=com":
S498d32e bdb_db_open: database "dc=yealink,dc=com": dbenu_open
S498d32f bdb_monitor_db_open:

The screenshot for reference is shown as below:

Please do not close this window to make sure the LDAP server keeps running.

Adding the Initial Entry to the LDAP Directory

You can add the initial entry to the LDAP directory by using the LDIF file. Create a new text document, then modify the filename extension as ldif and place the document to the OpenLDAP installation path. For example, create a text document named as test.txt, right click the test.txt document and then select to rename it, modify the filename extension as ldif. Open the LDIF file with your favorite text editor and input the corresponding content. The following shows an example of the content of the LDIF file:

dn: dc=yealink,dc=com objectClass: top objectClass: dcObject objectClass: domain dc: yealink

dn: ou=roles,dc=yealink,dc=com
objectClass: top
objectClass: organizationalUnit
ou: roles
dn: ou=people,dc=yealink,dc=com
objectClass: top
objectClass: organizationalUnit
ou: people
dn: cn=Test Users,ou=roles,dc=yealink,dc=com
objectClass: groupOfUniqueNames
cn: Test Users
uniqueMember:
uid=sspecial,ou=people,dc=yealink,dc=com
uniqueMember:
uid=jbloggs,ou=people,dc=yealink,dc=com
dn: cn=Special Users,ou=roles,dc=yealink,dc=com
objectClass: groupOfUniqueNames
cn: Special Users
uniqueMember: uid=sspecial,ou=people,dc=yealink,dc=com
uu-sspeciai,ou-people,uc-yeannik,uc-coni
dn: cn=Admin Users,ou=roles,dc=yealink,dc=com
objectClass: groupOfUniqueNames
cn: Admin Users
uniqueMember:
uid=admin,ou=people,dc=yealink,dc=com
dn: uid=admin,ou=people,dc=yealink,dc=com
objectClass: person
objectClass: inetOrgPerson
cn: State App
displayName: App Admin
givenName: App
mail: admin@fake.org

sn: Admin
uid: admin
userPassword: adminpassword
dn: uid=jbloggs,ou=people,dc=yealink,dc=com
objectClass: person
objectClass: inetOrgPerson
cn: Joe Bloggs
displayName: Joe Bloggs
givenName: Joe
mail: jbloggs@fake.org
sn: Bloggs
uid: jbloggs
userPassword: password
dn: uid=sspecial,ou=people,dc=yealink,dc=com
objectClass: person
objectClass: inetOrgPerson
cn: Super Special
displayName: Super Special
givenName: Super
mail: sspecial@fake.org
sn: Special
uid: sspecial
userPassword: password

To add the initial entry using the test.ldif file:

- 1. Click Start->Run.
- 2. Execute **cmd** in the pop-up dialogue box and click **OK** to enter the command line interface.
- **3.** Access the server installation path. For example, execute the following commands to access the server installation path at **D:\OpenLDAP**.

4. Execute the command slapadd -v -l ./test.ldif to add the initial entry.

The screenshot for reference is shown as below:

C:\Windows\system32\cmd.exe	
:\OpenLDAP>slapadd -v -l ./test.ldif 498c308 bdb_db_open: warning - no DB_CONFIG file fou	nd in directory ./data: (2)

Configuring the LDAPExploreTool2

The LDAPExploreTool2 application supports running on Windows system. The application is a graphical LDAP tool that enables you to browse, modify and manage contact entry on LDAP server.

If you have an LDAPExploreTool2 application installed on your computer, open it now, otherwise, download the application from http://ldaptool.sourceforge.net/. And then complete the installation following the wizard.

Creating a Configuration

To create a configuration:

- 1. Double click the LDAPExploreTool2.exe to run the application.
- 2. Click File->Configurations.

LDAPExplorerTool 2	
File Tools	
Open last configuration	
Configurations	
Quit	
	11.

3. Click New to create a new configuration.

4. Enter a name in the **Configuration name** field under the **Configuration** tab.

onfiguration			
Configuration Servi	er Connecti	on Option SSL/TLS	
Configuration name		LDAP	
	Ok	Cancel	

 Enter the domain name or IP address of the LDAP server in the Server name or IP field under the Server tab. Check the checkbox of Use default port for the Server port and Server SSL port.

Configuration		
Configuration Server	Connection Opti	ion SSL/TLS
Server name or IP	10.3.6.128	
Server port	389	🔽 Use default port
Server SSL port	636	🔽 Use default port
Version	G 3 ⊂ 2Test connection	1
	Ok Car	ncel

6. Enter the user DN and password in the **User DN** and **Password** field under the **Connection** tab.

The user DN and password correspond with the Rootdn and Rootpw defined in the slapd.conf file.

For example, according to the manager information defined in the slapd.conf file:

Rootdn "cn=Manager,dc=yealink,dc=com"

Rootpw secret

rver Connection Option	n SSL/TLS
=yealink,dc=com	C Anonymous login
*****	✓ Store password
C Yes € No	
← Yes ເ No dc=yealink,dc=ci	(TLS is only used on non SSL ports) Guess value
Test connection	
	=yealink,dc=com ****** ○ Yes ○ No ○ Yes ○ No dc=yealink,dc=co

Enter **cn=Manager,dc=yealink,dc=com** in the **User DN** field and **secret** in the **Password** field under the **Connection** tab.

- 7. Click Guess value to fill the Base DN automatically.
- **8.** Click **Test connection** to test the connection to the LDAP server. If you encounter an error or warning during the test, you need to resolve the error or warning first according to the prompt, and then retry to test the connection.
- 9. Click **OK** to accept the change.

Adding Entries

To add entries:

1. Click **File**->**Configurations**, select the configuration created above, and then click **Open**.

The screenshot for reference is shown as below:

LDAPExplorerTe	pol 2	
File Tools		
< m h	⊞ dc=yealink,dc=com	
		1.

2. Right click the root entry, and then select Add to add a new entry.

LDAPExplor	erTool 2		
File Tools			
- Root-dc=ye	ealink,dc=com	⊡ ou=roles,dc=yealink,dc=com	
⊖• <mark>ou=rc</mark>	Entry		
cn	Add		
⊡ cn ⊡ ou=p uic	Copy to Rename Delete		
- uic	Search		

3. Enter the desired values in the corresponding fields.

Parent DN: It will be automatically generated according to the server configuration.

Entry RDN: The format is cn=XXX. This is a unique identifier for each entry.

Object Class (from schema): Select the structure class which the entry belongs to. Each structure class has its own must attributes and may attributes. For example, we select **person** from the pull-down list of **Object class (from schema)**.

4. Select the desired attributes for object class.

Must attributes: Double click attributes to add them to the entry node. All attributes listed in the **Must attributes** field must be added and each value of the attribute must be set.

May attributes: Double click the desired attributes to add them to the entry node. The attributes listed in the **May attributes** field are optional.

Attribute	Name	Description
cn	commonName	Full name of the entry.
gn	givenName	First name also called Christian name.
sn	surname	Surname, last name or family name.
telephoneNumber	telephoneNumber	Office phone number.
homePhone	homeTelephoneNumber	Home phone number.
mobile	mobileTelephoneNumber	Mobile or cellular phone number.
pager	pagerTelephoneNumber	Pager telephone number.
company	company	Company name.
0	organizationName	Organization name.
ou	organizationlUnitName	Usual department or any sub entity of larger entity.

Common attributes are listed in the following table:

5. Right click the selected attribute and then select Add value.

New entry creation	23

Microsoft Active Directory

Installing the Microsoft Active Directory Domain Services

This section shows you how to install an active directory on Microsoft Windows Server 2008 R2 Enterprise 64-bit system.

To install the Microsoft Active Directory Domain Services:

- 1. Click Start->Run.
- 2. Enter dcpromo in the pop-up dialogue box and click OK.

3. The Active Directory Domain Services Installation Wizard will appear after a short while, click **Next**.

4. Read the provided information and click Next.

Active Directory Domain Services Installation Wizard	×
Operating System Compatibility Improved security settings in Windows Server 2008 and Windows Server 2008 R2 affect older versions of Windows	
 Windows Server 2008 and "Windows Server 2008 R2" domain controllers have a new more secure default for the security setting named "Allow cryptography algorith compatible with Windows NT 4.0." This setting prevents Microsoft Windows and non-Microsoft SMB "clients" from using weaker NT 4.0 style cryptography algorith when establishing security channel sessions against Windows Server 2008 or "Windows Server 2008 R2" domain controllers. As a result of this new default, operations or applications that require a security channel serviced by Windows Server 2008 or "Windows Server 2008 R2" domain controllers. As a result of this new default, operations or applications that require a security channel serviced by Windows Server 2008 or "Windows Server 2008 R2" domain controllers might fail. Platforms impacted by this change include Windows NT 4.0, as well as non-Micros SMB "clients" and network-attached storage (NAS) devices that do not support stronger cryptography algorithms. Some operations on clients running versions of Windows earlier than Windows Vista with Service Pack 1 are also impacted, includ domain join operations performed by the Active Directory Migration Tool or Window Deployment Services. For more information about this setting, see Knowledge Base article 942564 (http://go.microsoft.com/fwlink/?Linkld=104751). 	hms ns rver soft ding

Adding Entries to the Active Directory Using the Idifde Tool

You can use a LDIF file to perform a batch import of all entries to the active directory.

To create the LDIF file:

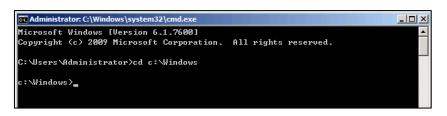

Create a new text document and then modify the filename extension as ldif. For example, create a text document named as test.txt, right click the test.txt document and then select to rename it, modify the filename extension as ldif. Open the LDIF file with your favorite text editor and input the corresponding content. The following shows an example of the content of the LDIF file:

##Create a new organizational unit##
dn: OU=yealink,DC=ldap,DC=yealink,DC=com
changetype: add
objectClass: top
objectClass: organizationalUnit
ou: yealink
name: yealink
##create a new contact##
dn: CN=san zhang,OU=yealink,DC=Idap,DC=yealink,DC=com
changetype: add
objectClass: top
objectClass: person
objectClass: organizationalPerson
objectClass: contact
cn: san zhang
sn: zhang
givenName: san
initials: zs
name: san zhang
ipPhone: 2336
mobile: 15557107369

To import the test.ldif file:

- 1. Click Start->Run.
- 2. Enter cmd in the pop-up dialogue box and click OK to enter the command line interface.

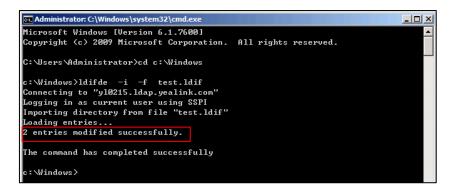

Execute the command cd to access the path of the test.ldif file. For example, execute cd c:\Windows to access the path of the test.ldif file at c:\Windows.

4. Execute the command ldifde -i -f test.ldif to import the file.

If the entries are added successfully, you can find the prompt "**n entries modified successfully**" ("n" indicates the number of the added entries).

The screenshot for reference is shown as below:

You can also export the existing entries on the active directory into a *.ldif file first, modify the file, and then import the modified file into the active directory. For more information, refer to the network resource.

Adding Entries to the Active Directory Using the Csvde Tool

You can also use a CSV file to perform a batch import of all entries to the active directory. Create a new document using a spreadsheet application (e.g., Microsoft Excel) and then save the document to your local computer using "Save as" in the format "*.csv". For example, create a document named as test.xls, click "Save as" to save the document as test.csv. Open the CSV file with the spreadsheet application and input the corresponding content. The following shows an example of the CSV file content:

٩.	test. csv * X 📄									
-	A	В	С	D	E	F	G	H	I	J
1	DN	objectClass	ou	name	cn	sn	givenName	initial s	ipPhone	mobile
2	OU=yealink,DC=1dap, DC=yealink,DC=com	organizationalUni t	yealink	yealink						
3	CN=san zhang, OU=yealink, DC =ldap, DC=yealink, DC =com	contact		san zhang	san zhang	san	zhang	sz	1111	123456789001
	CN=si li,OU=yealink,DC=ld ap,DC=yealink,DC=co	contact		si li	si li	11	si	sl	2222	123456789002
5	CN=wu wang, OU=yealink, DC= ldap, DC=yealink, DC= com	contact		wu wang	wu wang	wang	₩u	ww	3333	123456789003

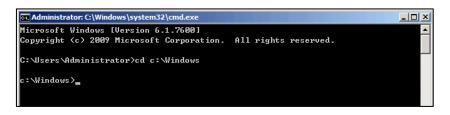

The first line lists the attributes of the entries.

The second line lists the values of an organizational unit in the corresponding attribute columns.

The other lines list the values of contacts in the corresponding attribute columns.

To import the test.csv file:

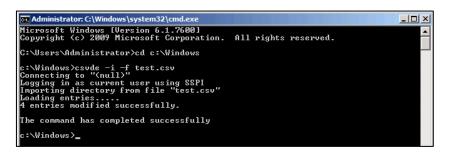

- 1. Click Start->Run.
- 2. Enter cmd in the pop-up dialogue box and click OK to enter the command line interface.
- Execute the command cd to access the path of the test.csv file. For example, execute cd c:\Windows to access the path of the test.csv file at c:\Windows.

4. Execute the command csvde -i -f test.csv to import the file.

If the entries are added successfully, you can find the prompt "**n entries modified successfully**" ("n" indicates the number of the added entries).

The screenshot for reference is shown as below:

The csvde tool cannot edit or delete the existing entries on the active directory.

You can also export the existing entries on the active directory into a *.csv file first, modify the file, and then import the modified file into the active directory. For more information, refer to the network resource.

Creating User Accounts

You can create user accounts to allow access to resources on the active directory. User accounts are very important and useful.

To create a user account:

- 1. Click Start->Administrative Tools->Server Manager.
- 2. Double click Server Manager->Roles->Active Directory Domain Services->Active

Directory Users and Computers.

- **3.** Select the domain name created above (e.g., Idap.yealink.com).
- 4. Right click **Users**, and then select **New**->**User**.

Server Manager (YL0215)		Users 16 objects	s [Filter Activated]		Actions

Microsoft Active Directory Application Mode

Microsoft Active Directory Application Mode (ADAM) is a new mode of Active Directory that is designed specifically for directory-enabled applications. ADAM is a Lightweight Directory Access Protocol (LDAP) directory service that runs as a user service, rather than as a system service. You can run ADAM on servers and domain controllers running operating systems in the Windows

Server 2003 family. This section shows you how to install Active Directory Application Mode (ADAM) on Microsoft Windows Server 2003 SP2 Enterprise 32-bit system. You can download Active Directory Application Mode (ADAM) online:

http://www.microsoft.com/en-us/download/confirmation.aspx?id=4201.

Installing the Active Directory Application Mode

To install the Active Directory Application Mode:

- **1.** Double click ADAMSP1_x86_English.exe to run the application.
- 2. The Active Directory Application Mode Service Park 1 Installation Wizard will appear after a short while, click **Next**.

Software Update Installation	Wizard 🗙
Ð	Use this wizard to install the following software update: Active Directory Application Mode Service Pack 1
	Before you install this update, we recommend that you: - Back up your system - Close all open programs You might need to restart your computer after you complete this update. To continue, click Next.
	< <u>B</u> ack [<u>N</u> ext >] Cancel

3. Read the software license agreement and mark I Agree radio box. And then click Next.

Software Updat	e Installation Wizard 🛛 🗙

Ð	Completing the Active Directory Application Mode Service Pack 1 Installation Wizard
	You have successfully completed the ADAM SP1 Setup Wizard.
	To close this wizard, click Finish.
	< Back Finish Cancel

To create an ADAM instance:

1. Click Start->Programs->ADAM->Create an ADAM instance.

It will prompt the following interface and click **Next**.

掃 Active Directory Applicati	on Mode Setup Wizard	×
Æ	Welcome to the Active Directory Application Mode Setup Wizard	
	This wizard helps you install Microsoft Active Directory Application Mode (ADAM).	
	ADAM is a powerful directory service that is easy to install and deploy. It provides a dedicated data store for applications, and can be configured and managed independently.	
	To continue, click Next.	
	< Back Next> Cancel Help	

2. Mark the A unique instance radio box and click Next.

🖶 Active Directory Application Mode Setup Wizard	×
Setup Options An ADAM instance is created each time ADAM is installed.	Ð
You can create a unique instance, or you can install a replica of an existing instance.	
Select the type of instance you want to install.	
• A unique instance	
This option automatically creates a new instance of ADAM that uses the default configuration and schema partitions. The new instance will not be able to replicate with existing instances.	
O A replica of an existing instance	
This option creates a new instance of ADAM that uses the configuration and schema partitions replicated from another instance of ADAM. You can also select the application partitions to replicate.	
< <u>B</u> ack <u>N</u> ext> Cancel Hel	p

3. Enter the desired name in the **Instance name** field and click **Next**.

🖶 Active Directory Application Mode Setup Wizard	×
Instance Name The instance name is used to differentiate this instance of ADAM from other ADAM instances on this computer.	Ð
Type a name for this instance. The name should reflect the use for which this instanc of ADAM is intended.	е
Instance name:	
instance1	_
, Example: Addressbook1 The ADAM service name is created when the instance name is combined with the product name. It will be displayed in the list of Windows services. ADAM service name: ADAM_instance1	
< <u>B</u> ack <u>N</u> ext > Cancel H	lelp

4. Keep the default ports and click **Next**.

🛱 Active Directory Application Mode Setup Wizard 🛛 🗙
Ports Computers will connect to this instance of ADAM using specific ports on all of the IP addresses associated with this computer.
The ports displayed below are the first available for this computer. To change these ports, type the new port numbers in the text boxes below. If you plan to install Active Directory on this computer, do not use 389 for the LDAP port or 636 for the SSL port because Active Directory uses these port numbers. Instead, use available port numbers from the following range: 1025-65535.
LDAP port number: SSL port number: 636

Sun One Directory Server

Sun One Directory Server, also known as Sun Java System Directory Server, is a component of the Java Enterprise System. Sun One Directory Server can be installed on multiple platforms, such as Windows, Linux, Solaris and so on. This section shows you how to install Sun One Directory Server version 5.2 on Microsoft Windows Server 2003 SP2 Enterprise 32-bit system. You can download it online: http://download.csdn.net/download/wbsoso/6439291.

Before the installation, you should prepare as follows:

- Modify the hosts file of your computer.
- Install the Java Development Kit (JDK) 5 or later.

To modify the hosts file of your computer:

- 1. Locate the hosts file in the path "C:\WINDOWS\system32\drivers\etc\hosts".
- 2. Open and edit the hosts.dz file using your favorite text editor.
- **3.** Add FQCN (Fully Qualified Computer Name) of your computer to the file. For example, the FQCN of your computer is Idapsun.yealinktest.com. Add the following mapping:

127.0.0.1 Idapsun.yealinktest.com

l Copyright (c) 1993 L	-1999 Microsoft Corp.	
	OSTS file used by Micro	soft TCP/IP for Windows.
entry should be ke be placed in the f	pt on an individual lin irst column followed by	resses to host names. Each e. The IP address should the corresponding host name. e separated by at least one
Additionally, comm lines or following	ents (such as these) ma the machine name denot	y be inserted on individual ed by a '#' symbol.
For example:		
102.54.94.97	rhino.acme.com	# source server
38.25.63.10	x.acme.com	# x client host
27.0.0.1 loca	lhost	
27.0.0.1 1dap	sun.yealinktest.com	

4. Save the hosts file.

The following shows you how to install Java Development Kit (JDK) 6 on your computer. You can download it online: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

To install the Java Development Kit (JDK) 6:

1. Double click jdk-6u22-windows-i586.exe to run the application.

2. The Java (TM) SE Development Kit 6 Update 22 Installation Wizard will appear after a short while, click **Next**.

 Click Change to locate the installation path from local computer system and then click Next.

You need to remember the installation path (e.g., C:\Program Files\Java\jdk1.6.0_22) located here.

The screenshot for reference is shown as below:

4. Click **Finish** to finish the installation.

After the installation, you need to configure environment variables.

To configure environment variables:

- 1. Right-click the My Computer icon and select Properties.
- 2. Click the **Advanced** tab.
- 3. Click the Environment Variables button.
- 4. Add the following variables, click New under System Variables.
- 5. Enter the variable name as JAVA_HOME.
- **6.** Enter the variable value as the installation path (e.g., C:\Program Files\Java\jdk1.6.0_22) for the Java Development Kit.

New System Varia	able ? 🗙
Variable <u>n</u> ame:	JAVA_HOME
Variable <u>v</u> alue:	C:\Program Files\Java\jdk1.6.0_22
	OK Cancel

- 7. Click OK.
- 8. Repeat the steps 4-7 to create a new system variable.

Variable name: classpath

Variable value: .;%JAVA_HOME%\lib\dt.jar;%JAVA_HOME%\lib\tools.jar The dot "." stands for the current path and it can't be deleted. %JAVA_HOME% references the value of the specified JAVA_HOME variable created before.

Edit System Varia	able ? 🗙
Variable <u>n</u> ame:	classpath
Variable <u>v</u> alue:	;%JAVA_HOME%\lib\dt.jar;%JAVA_HOME
	OK Cancel

- 9. Under System Variables, select the Path variable and click Edit.
- In the Variable value field, append the Java bin directory (e.g., C:\Program Files\Java\jdk1.6.0_22\bin) to the end of the existing path (e.g., %SystemRoot%\system32;%SystemRoot%;%SystemRoot%\System32\Wbem;).

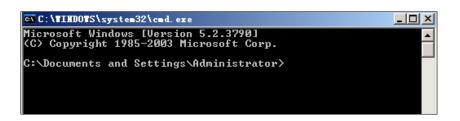

If the end of the existing path has no semicolon, you should add a semicolon to the end of the existing path and then append the Java bin directory.

Edit System Variat	ole ? 🗙
Variable <u>n</u> ame: Variable value:	Path em;C\$\Program Files\Java\jdk1.6.0_22\bin
_	OK Cancel

- **11.** Click **OK**.
- 12. Click Apply Changes.

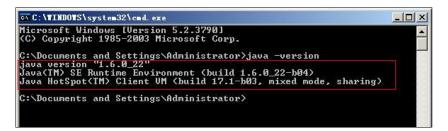

To verify the configuration of environment variables:

- 1. Click Start->Run.
- 2. Enter cmd in the pop-up dialogue box and click OK to enter the command line interface.

3. Execute the command java -version to check the java version.

It prompts the following information.

4. Execute the command **java** to run the application.

It prompts the following information.

5. Execute the command javac to compile java files into class files.

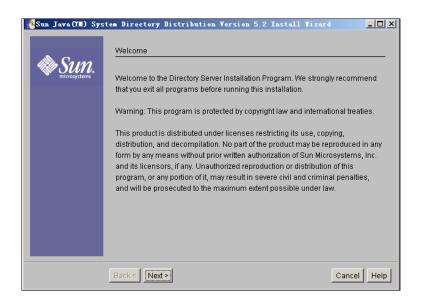

It prompts the following information.

Installing the Sun One Directory

To install the Sun One Directory:

- **1.** Unpack the compressed files named Sun Java System Directory Server.5.2.P4.Windows.full.rar.
- 2. Double click setup.exe to run the application.
- **3.** The Sun Java(TM) System Directory Distribution Version 5.2 Install Wizard will appear after a short while, click **Next**.

4. Read the software license agreement and click Yes (Accept License).

 Enter the fully qualified name of the computer (e.g., ldapsun.yealinktest.com) in the Fully Qualified Computer Name field and click Next.

The fully qualified name of the computer was planned before. For more information, refer to modify the hosts file of your computer.

Configuring the Sun Java(TM) System Server Console

Adding an Entry to the Directory Server

You can add entries to the Directory Server one by one in this way.

To add an entry to the Directory Server:

1. Click Start->Program->Sun Java(TM) System Server Products->Sun Java(TM) System Server Console 5.2.

It will enter the login screen. You should enter the administrator user name and its password in the **User ID** field and **Password** field respectively.

S	Sun Java(TE) System Server Console Login X
Ser	User ID: cn=Directory Manager
Sei	Password: ******
	Administration URL: http://dapsun.yealinktest.com:28512 💌
Copyright 20	<u>OK</u> <u>Cancel</u> <u>H</u> elp rved.
Sun, Sun	Microsystems, Sun Java(TM) System, and all Sun and Sun Java(TM) System based trademarks and logos are trademarks of Sun Microsystems, Inc.
	Please log in

The system default administrator is cn=Directory Manager and its password which must be at least 8 characters long has already been set during the installation process.

Then click **OK** to enter the home page.

Adding Entries to the Directory Server Using the Idifde Tool

You can use a LDIF file to perform a batch import of all entries to the Directory Server. For more information, refer to create the LDIF file. The following shows an example of the content of the LDIF file for the Directory Server:

##Create a new organizational unit##
dn: ou=ou3,dc=yealinktest,dc=com
ou: ou3
objectClass: top
objectClass: organizationalunit
creatorsname: cn=directory manager
modifiersname: cn=directory manager
parentid: 1
entryid: 15
entrydn: ou=ou3,dc=yealinktest,dc=com
##create a new user##
dn: uid=utest,ou=ou3,dc=yealinktest,dc=com
uid: utest
facsimileTelephoneNumber: 11002
givenName: user4
objectClass: top
objectClass: person
objectClass: organizationalPerson
objectClass: inetorgperson
sn: test
cn: user4 test

To import the test.ldif file:

- In the home page of Sun Java(TM) System Server Console, double click Idapsun.yealinktest.com->Server Group->Directory Server(Idapsun).
 - It will enter the Directory Tasks interface.

Configuring Yealink IP Phones

LDAP is disabled on IP phones by default. You can configure LDAP via web user interface or using configuration files.

LDAP Attributes on the Phone

Enable LDAP	
Parameter	ldap.enable
Description	This parameter enables or disables LDAP feature on the IP phone.
	0 -Disabled (Default)
	1-Enabled
LDAP Search	
Parameter	ldap.search_type
Description	This parameter configures the search type for LDAP contact look up. 0 -Prefix matching
	1-Approximate string matching
	If it is set to 0 (Perfect matching), the IP phone will search the LDAP
	contacts that the phone number or name starts with the entered character(s).
	If it is set to 1 (Approximate string matching), the IP phone will search the LDAP contacts that the phone number or name contains the entered character(s).
LDAP Name Filt	ter
Parameter	ldap.name_filter
Description	This parameter specifies the search criteria for names look up. The format of the search criteria is compliant to the standard string representations of LDAP search filters (RFC 2254). The "*" symbol in the filter stands for any character. The "%" symbol in the filter stands for the name entered by the user.
Example	 ((cn=%)(sn=%)(telephoneNumber=%)) When the cn or sn or telephoneNumber of the LDAP contact matches the entered name, the record will be displayed on the phone LCD screen. (&(cn=*)(sn=%))
	When the cn of the LDAP contact is set and the sn of the LDAP contact matches the entered name, the records will be displayed on

	the phone LCD screen.			
	• (!(cn=%))			
	When the cn of the LDAP contact does not matches the entered			
	name, the records will be displayed on the phone LCD screen.			
LDAP Number I	Filter			
Parameter	ldap.number_filter			
Description	This parameter specifies the search criteria for numbers look up. The format of the search criteria is compliant to the standard string representations of LDAP search filters (RFC 2254). The "*" symbol in the filter stands for any number. The "%" symbol in the filter stands for the number entered by the user.			
Examples	 ((telephoneNumber=%)(mobile=%)(ipPhone=%)) 			
	When the telephoneNumber or mobile or ipPhone of the LDAP contact matches the search criteria, the record will be displayed on the phone LCD screen.			
	 (&(telephoneNumber=*)(mobile=%)) 			
	When the telephoneNumber of the LDAP contact is set and the mobile of the LDAP contact matches the entered number, the record will be displayed on the phone LCD screen.			
LDAP TLS Mode	e			
Parameter	ldap.tls_mode			
Description	This parameter specifies the connection mode between the LDAP server and the IP phone.			
	0 -LDAP (Default)–Unencrypted connection between LDAP server and the IP phone. (port 389 is used by default).			
	1 -LDAP TLS Start-TLS/SSL connection between LDAP server and the IP phone (port 389 is used by default).			
	2 -LDAPs-TLS/SSL connection between LDAP server and the IP phone (port 636 is used by default).			
	Note: It is only applicable to IP phones running firmware version 73 or later.			
Server Address				
Parameter	ldap.host			
Description	This parameter specifies the domain name or IP address of the LDAP			
	server.			
Default Value				

Port Parameter Idap.port Description This parameter specifies the LDAP server port. Default Value 389 Base Parameter Idap.base Idap.base Description This parameter specifies the LDAP search base which corresponds to t	he				
Description This parameter specifies the LDAP server port. Default Value 389 Base Idap.base	he				
Default Value 389 Base Idap.base	he				
Base Parameter Idap.base	he				
Parameter Idap.base	he				
	he				
Description This parameter specifies the LDAP search base which corresponds to t	he				
location in the LDAP directory. The search base narrows the search sco and decreases directory search time.	ope				
Example • dc=yealink,dc=com					
Username					
Parameter Idap.user					
DescriptionThis parameter specifies the user name to login the LDAP server. If the LDAP server allows anonymous to login, this parameter can be left bla Otherwise you need to provide the user name to access the LDAP server Note: If you use Microsoft Active Directory Application Mode (ADAM) 	ink. ver.) as				
Password					
Parameter Idap.password					
DescriptionThis parameter specifies the password to login the LDAP server. If the LDAP server allows anonymous to login, this parameter can be left bla Otherwise you need to provide the password to access the LDAP server					
Max Hits (1~32000)					
For T48S/T46S/T42S/T41S/T40P/T40G/T27G/T23P/T23G/T21(P) E2/T19(P) E2/CP9	<u>20:</u>				
Max Hits (1~1000)					
Parameter Idap.max_hits					
Description This parameter specifies the maximum number of the search results to returned by the LDAP server. If the value of the "Max.Hits" is blank, the LDAP server will return all searched results. Please note that a very large value of the "Max. Hits" will slow down the LDAP search speed, therefore the parameter should be configured according to the available bandward of the search and the parameter should be configured according to the available bandward of the search according to the	e ge ore				
Default Value 50					
LDAP Name Attributes					

Parameter	ldap.name_attr
Description	This parameter specifies the name attributes of each record to be returned by the LDAP server. This parameter compresses the search results. The user can configure multiple name attributes separated by space.
Example	 cn sn displayName This requires the "cn", "sn" and "displayName" attributes set for each contact record on the LDAP server. givenName This requires the "givenName" attribute set for each contact record on the LDAP server.
LDAP Number	Attributes
Parameter	ldap.numb_attr
Description	This parameter specifies the number attributes of each record to be returned by the LDAP server. This parameter compresses the search results. The user can configure multiple number attributes separated by space.
Example	 mobile telephoneNumber ipPhone This requires the "mobile", "telephoneNumber" and "ipPhone" attributes set for each contact record on the LDAP server.
LDAP Display N	lame
Parameter	ldap.display_name
Description	This parameter specifies the display name of the contact record displayed on the LCD screen. This parameter value must start with "%" symbol.
Example	 %cn The desired display name of the contact record is the cn attribute.
Protocol	
Parameter	ldap.version
Description	This parameter specifies the LDAP protocol version supported on the phone. Make sure the protocol value corresponds with the version assigned on the LDAP server. 2-Version 2 3-Version 3 (Default)
LDAP Lookup F	or Incoming Call
Parameter	ldap.call_in_lookup
Description	This parameter enables or disables the phone to perform an LDAP search when receiving an incoming call.

	0-Disabled (Default)					
	1-Enabled					
	Note : If the caller number contains the special characters (e.g., "+", "." or the space), the phone will match the search criteria in the parameter "LDAP Name Filter (Idap.name_filter)". If not, the phone will match the search criteria in the parameter "LDAP Number Filter (Idap.number_filter)					
LDAP Lookup For Callout						
Parameter	meter Idap.call_out_lookup					
Description	This parameter enables or disables the phone to perform an LDAP search when placing a call. 0 -Disabled (Default) 1 -Enabled Note : If the called number contains the special characters (e.g., "+", "." or the space), the phone will match the search criteria in the parameter "LDAP Name Filter (Idap.name_filter)". If not, the phone will match the search criteria in the parameter "LDAP Number Filter (Idap.number_filter)".					
LDAP Sorting R	esults					
Parameter	ldap.ldap_sort					
Description	This parameter enables or disables the phone to sort the search results in alphabetical order or numerical order. 0 -Disabled (Default) 1 -Enabled					
LDAP Special Se	earch					
Parameter	ldap.incoming_call_special_search.enable					
Description	This parameter enables or disables the phone to search the telephone numbers starting with "+" symbol and "00" from the LDAP server if the incoming phone number starts with"+" or "00". When completing the LDAP search, the all search results will be displayed on the LCD screen. 0 -Disabled (Default) 1 -Enabled For example, If the phone receives an incoming call from the phone number 0044123456789, it will search 0044123456789 from the LDAP sever first, if no result found, it will search +44123456789 from the server again. The phone will display all the search results. Note: It works only if the value of the parameter "Idap.call_in_lookup" is					
	set to 1 (Enabled). You may need to set the value of the parameter "Idap.name_filter" to be					

	((cn=%)(sn=%)(telephoneNumber=%)(mobile=%)) for searching the				
	telephone numbers starting with "+" symbol.				
LDAP Label	LDAP Label				
Parameter	ldap.customize_label				
Description	It configures the display name of the LDAP phone book.				
	Example:				
	ldap.customize_label = Friends				
	Note: It works only if "Idap.enable" is set to 1 (Enabled).				

Configuring LDAP via Web User Interface

The followings take configurations of a SIP-T29G IP phone running firmware version 81 as examples.

To configure LDAP feature via web user interface:

- 1. Press the **OK** key on the phone when it is idle to obtain the IP address.
- 2. Enter the IP address (e.g., http://192.168.0.10 or 192.168.0.10) in the address bar of web browser on your PC and then press **Enter**.
- 3. Enter the user name and password in the login page.

The default login user name is admin (case-sensitive) and the password is admin (case-sensitive).

- 4. Click on **Directory**->LDAP.
- 5. Select Enabled from the pull-down list of Enable LDAP.
- 6. Enter the desired values in the corresponding fields.

7. Click **Confirm** to accept the change.

Example for Web User Interface Configuration

You can use the following settings as a starting point and adjust the filter and display attributes according to your requirements. The following shows example of OpenLDAP phone configurations.

Enable LDAP: Enabled
LDAP Name Filter: ((cn=%)(sn=%))
LDAP Number Filter: ((telephoneNumber=%)(mobile=%)(ipPhone=%))
LDAP TLS Mode: LDAP
Server Address: 10.3.6.128
Port: 389
Base: dc=yealink,dc=com
Username: cn=Manager,dc=yealink,dc=com
Password: secret
Max Hits (1~32000): 50
LDAP Name Attributes: cn sn
LDAP Number Attributes: mobile telephoneNumber ipPhone
LDAP Display Name: %cn
Protocol: Version 3
LDAP Lookup For Incoming Call: Enabled
LDAP Lookup For Callout: Enabled
LDAP Sorting Results: Enabled

To use LDAP feature, you need to configure a DSS key as an LDAP key.

To configure an LDAP key via web user interface (not applicable to W52P/W53P/W56P/W60P):

- **1.** Log into the web user interface of the phone.
- 2. Click on Dsskey->Line Key (or Programable Key).

3. In the desired DSS key field, select LDAP from the pull-down list of Type.

Configuring LDAP Using Configuration Files

To configure LDAP feature using configuration files:

1. Add/Edit LDAP parameters in the configuration file.

The following table shows the information of parameters:

Parameter	Descriptions	Web Setting Path	
ldap.enable		Directory->LDAP->Enable LDAP	
ldap.search_type (not applicable to CP860/CP920 IP phones)	These parameters specify the LDAP attributes.	/	
ldap.customize_label		Directory->LDAP->LDAP Label	
ldap.name_filter		Directory->LDAP->LDAP Name Filter	
ldap.number_filter	Refer to the introduction above for more	Directory->LDAP->LDAP Number Filter	
ldap.tls_mode	information.	Directory->LDAP->LDAP TLS Mode	
ldap.host		Directory->LDAP->Server Address	
ldap.port		Directory->LDAP->Port	
ldap.base		Directory->LDAP->Base	

Parameter	Descriptions	Web Setting Path
ldap.user		Directory->LDAP->User Name
ldap.password		Directory->LDAP->Password
		Directory->LDAP->Max Hits (1~32000)
		<u>For</u> <u>T48S/T46S/T42S/T41S/T40P/T</u>
ldap.max_hits		40G/T27G/T23P/T23G/T21(P)
		E2/T19(P) E2/CP920:
		Directory->LDAP->Max Hits (1~1000)
ldap.name_attr		Directory->LDAP->LDAP Name Attributes
ldap.numb_attr		Directory->LDAP->LDAP Number Attributes
ldap.display_name		Directory->LDAP->LDAP Display Name
Idap.version		Directory->LDAP->Protocol
ldap.call_in_lookup		Directory->LDAP->LDAP Lookup For Incoming Call
ldap.call_out_lookup		Directory->LDAP->LDAP Lookup For Callout
ldap.ldap_sort		Directory->LDAP->LDAP Sorting Results
ldap.incoming_call_spec ial_search.enable		/

2. Upload configuration files to the root directory of the provisioning server and trigger IP phones to perform an auto provisioning for configuration update.

For more information on auto provisioning, refer to the latest Auto Provisioning Guide for your phone on Yealink Technical Support.

Example for Configuration Parameters

You can use the following settings as a starting point and adjust the filter and display attributes according to your requirements. The following shows example of OpenLDAP phone configurations.

ldap.enable=1
ldap.search_type = 1
ldap.name_filter= ((cn=%)(sn=%))
ldap.number_filter= ((telephoneNumber=%)(mobile=%)(ipPhone=%))
ldap.tls_mode=0
ldap.host= 10.3.6.128
ldap.port= 389
ldap.base= dc=yealink,dc=com
ldap.user= cn=Manager,dc=yealink,dc=com
ldap.password= secret
ldap.max_hits= 50
ldap.name_attr= cn sn
ldap.numb_attr= mobile telephoneNumber ipPhone
ldap.display_name = %cn
ldap.version= 3
ldap.call_in_lookup= 1
ldap.call_out_lookup= 1

ldap.ldap_sort= 1

To use LDAP feature, you need to configure a DSS key as an LDAP key.

To configure an LDAP key using configuration files:

1. Add/Edit the LDAP key parameters in the configuration file.

You can configure a memory key, a line key or a programable key as an LDAP key. The following table shows the information of parameters:

Parameter	Description	Value
linekey.X.type		
(not applicable to SIP-T19(P) E2/CP860/		
CP920/W52P/W53P/W56P/W60P IP phones)		
(CP960: X ranges from 1 to 30;	Configures a line key as an LDAP key on the IP	38
SIP VP-T49G/SIP-T48G/T48S: X ranges from 1 to 29;	phone.	50

13;	phone.	
SIP-T29G/T27G: X=1-14;		
SIP-T23P/T23G/T21(P) E2: X=1-10, 14;		
CP860/CP920: X=1-6, 9, 13)		

2. Upload configuration files to the root directory of the provisioning server and trigger IP phones to perform an auto provisioning for configuration update.

For more information on auto provisioning, refer to the latest Auto Provisioning Guide for your phone on Yealink Technical Support.

Using LDAP Directory on Yealink IP Phones

For SIP-T2 Series, T19(P) E2, T4 Series, T5 Series and CP Series IP Phones

You can press the LDAP key to access the LDAP directory. Enter the desired numbers to match the search criteria for searching a contact from LDAP directory, add local contacts from LDAP directory, and dial a contact from LDAP directory. You can also enable the phone to perform an LDAP search when receiving an incoming call or dialing an outgoing call.

To search a contact from the LDAP directory:

 Press the LDAP key to access the LDAP search screen. The LCD screen prompts "None".

2. Enter a few continuous characters of the contact name or continuous digits of the contact phone number using the keypad.

LDAP		
	5578	
ABC	Delete	
		5578

The contacts which match the search criteria will appear on the LCD screen.

- **3.** Press (\bullet) or (\bullet) to select the desired contact.
- 4. Do one of the following:
 - Press the **Option** soft key and then select **Detail** to view the detail information of the contact.

- Press the **Option** soft key and then select **Add to Contact** to add the contact to local.
- Press the **Send** soft key to dial out.

If the **LDAP Lookup For Incoming Call** parameter is enabled on the phone, the phone will perform an LDAP search when receiving an incoming call. If there is a contact record which matches the caller ID, the contact name will be displayed on the phone LCD screen as the calling line identification.

The screenshot of the LCD screen for reference is shown as below:

The **Search Source List In Dialing** feature enables the phone to perform an LDAP search when you enter the digits using the keypad in the dialing interface. For more information on the configuration of the Search Source List In Dialing feature, refer to *Yealink phone-specific user guide*.

If there are contact records matching the search criteria, the contact records will be listed on the phone LCD screen. You can select the desired contact record to dial out. The contact name will be displayed on the phone LCD screen during the call.

∢) 2900			
2224	55		
S 2900	Hebe Tian	5578	1
LDAP			
Send	123	Delete	EndCall

The screenshot of the LCD screen for reference is shown as below:

If the **LDAP Lookup For Callout** parameter is enabled on the phone, the phone will perform an LDAP search when dialing an outgoing call. If there is a contact record which matches the called ID, the contact name will be displayed on the phone LCD screen as the called line identification. The screenshot of the LCD screen for reference is shown as below:

For W52P/W53P/W56P/W60P DECT IP Phones

You can access to the LDAP directory and enter the desired numbers to match the search criteria for searching a contact, add local contacts from LDAP directory, and dial a contact from LDAP directory. You can also enable the DECT phone to perform an LDAP search when receiving an incoming call or dialing an outgoing call.

To search a contact from the LDAP directory:

1. Press OK->Directory->LDAP.

The LCD screen of handset displays the contact list.

2. Enter a few continuous characters of the contact name or continuous digits of the contact phone number using the keypad.

The contacts which match the search criteria will display on the LCD screen.

- **3.** Press \blacktriangle or \blacktriangledown to select the desired contact.
- 4. Do one of the following:
 - Press the **Options** soft key and then select **Detail** to view the detail information of the contact.
 - Press the **Options** soft key and then select **Add to Local** to add the contact to local.
 - Press 🌈 or 🔳 to dial out.

If the **LDAP Lookup For Incoming Call** parameter is enabled on the DECT phone, the DECT phone will perform an LDAP search when receiving an incoming call. If there is a contact record which matches the caller ID, the contact name will be displayed on the handset LCD screen as the calling line identification.

The **Search Source List In Dialing** feature enables the phone to perform an LDAP search when you enter the digits using the keypad in the dialing interface. For more information on the configuration of the Search Source List In Dialing feature, refer to Yealink phone-specific user guide.

If there are contact records matching the search criteria, the contact records will be listed on the handset LCD screen. You can select the desired contact record to dial out. The contact name will be displayed on the handset LCD screen during the call.

If the **LDAP Lookup For Callout** parameter is enabled on the DECT phone, the DECT phone will perform an LDAP search when dialing an outgoing call. If there is a contact record which matches the called ID, the contact name will be displayed on the handset LCD screen as the called line identification.
